01 System Overview

GetiDone is a distributed, AI-augmented marketplace system built on a multi-layer architecture designed for trust, scalability, and performance-driven execution.

Core Layers

Application Layer

Frontend interfaces + API routing

Business Logic Layer

Core microservices & workflow engines

AI & Scoring Layer

Matching, Done Score™ & fraud detection

Data Layer

Databases + analytics warehouse

Trust & Compliance

KYC, behavior scoring, dispute resolution

Monetization & Payment

Escrow, commissions, subscriptions, QA/QC fees

02 — High-Level Architecture

System Flow & Mental Model

Frontend (Web + Mobile) ↓
API Gateway (Auth, Routing, Rate Limiting) ↓
Microservices Layer (User, Job, Matching, QA, Rewards) ↓
Core Engines (Done Score, QA/QC, AI Matching, Escrow) ↓
Databases + Data Warehouse (PostgreSQL, Redis, BigQuery) ↓
AI Models / Analytics Layer (Training, Insights, Dashboards)

03 Frontend Architecture

Recommended Stack

React / Next.js

Primary web framework for SSR and performance

React Native

Cross-platform mobile applications (iOS & Android)

TailwindCSS

Utility-first styling for consistent, scalable UI design

Core Interfaces

Freelancer Dashboard

Job tracking, Done Score visibility, earnings, tier status

Client Dashboard

Project management, hiring tools, escrow tracking, analytics

Admin Panel

User management, dispute resolution, platform metrics, KYC approval

QA/QC Dashboard

Review assignments, scoring interface, feedback logging, audit trails

Key UX Systems

- ✓ **Smart Hiring UI:** AI-powered suggestions with match confidence scores
- ✓ **Done Score Visibility:** Real-time merit ranking displayed prominently
- ✓ **Trust Badges & Tiers:** Visual indicators for verified, premium, and trusted users
- ✓ **QA/QC Request Flow:** Seamless pre/post submission quality validation prompts
- ✓ **Mobile-First Design:** Optimized for cross-border workers with varying connectivity

04 Backend Architecture

4.1 User Service

Authentication

JWT / OAuth 2.0 with multi-factor support

Profile Management

Dynamic skill tagging, portfolio hosting, verification status

KYC Verification

Identity validation, document processing, compliance checks

Notification Service

Real-time alerts via WebSocket, email, and push notifications

4.2 Job Marketplace Service

- ✓ Job posting, categorization, and requirement parsing
- ✓ AI-driven job assignment & direct allocation for premium freelancers
- ✓ Escrow lifecycle management (funding, holding, releasing)
- ✓ Milestone tracking and progress validation

4.3 Matching Engine (AI-Assisted)

Inputs

Job requirements

Done Score™

Skill match

Historical success

Outputs

Ranked list

Auto-assignment

Match %

4.4 Done Score™ Engine

Weighted scoring system calculating real-time merit (0–100) + tier classification.

$$\text{Done Score} = (\text{Review} \times 25\%) + (\text{Completion} \times 20\%) + (\text{Timeliness} \times 15\%) + (\text{QA/QC} \times 15\%) + (\text{Trust} \times 15\%) + (\text{Engagement} \times 10\%)$$

Core Rule: Cannot be influenced by payment or subscriptions. Continuously updated in real-time.

04 QA/QC Engine

Trigger Points & Workflow

Trigger Points

- ✓ Freelancer requests QC before submission
- ✓ Client requests QC after submission
- ✓ System prompts both parties for high-value jobs

QA/QC Workflow

Job Completed → QC Requested → Assigned to QA → Evaluation → Score Generated → Feedback Logged → Influences Done Score™

QA/QC Scoring Model

METRIC	WEIGHT
Requirement Match	30%
Quality of Execution	25%
Technical Accuracy	20%
Usability	15%
Documentation	10%

QA/QC Pricing Tiers

TIER	PRICE RANGE	SCOPE
Basic	\$10 – \$30	Surface-level validation
Standard	\$30 – \$100	Functional + quality review
Deep Audit	\$100 – \$300+	Full technical + business validation

System Impact: QA Score feeds directly into Done Score™. High QA scores = ranking boost. Low QA scores = ranking penalty.

04 Reward & Payment Systems

4.6 Reward Engine

Client Rewards (3%)

Triggered by spending thresholds. Outputs platform credits (non-cumulative, platform-bound).

```
If client_spend ≥ threshold:  
    credit = spend × 3%  
    assign_credit(client)
```

Freelancer Rewards

Non-monetary incentives:

Visibility Boost

Priority Allocation

Trust Badges

Reduced Commission

Referral System (Credit-Based)

User invites → New user signs up → User completes first transaction → Referrer gets platform credit

Key Rule: Credits must be used (cannot withdraw). Prevents revenue leakage and drives platform retention.

4.7 Payment & Escrow System

Core Components

Payment Gateway

Stripe / Paystack / Flutterwave
for multi-region processing

Escrow Wallet

Secure holding system with
automated release conditions

Commission Logic

Automated deduction engine
with tiered rate application

Payment Flow

Client pays → Funds locked in Escrow → Job completed & verified → Release payment → Commission deducted → Freelancer receives balance

05 Data Architecture

Primary Database

PostgreSQL

Users, Jobs, Contracts, Payments, Reviews, QA Reports, Done Scores

Realtime / Cache

Redis

Session caching, Real-time rankings, Live notifications, Rate limiting

Data Warehouse

BigQuery / Snowflake

Analytics, AI model training, Revenue modeling, User behavior tracking

06 — AI & Analytics Layer

AI Systems

Matching AI

Recommends best freelancers based on multi-dimensional compatibility scoring

Fraud Detection AI

Detects fake reviews, flags suspicious behavior, prevents platform manipulation

Done Score Optimization AI

Adjusts weights dynamically, prevents gaming, ensures merit integrity

Analytics Dashboards

GMV Tracking

Conversion Funnels

Freelancer Performance

Client Behavior Scoring

07 — Trust & Compliance Layer

Core systems ensuring platform integrity, user safety, and regulatory compliance.

KYC Verification

Identity validation, document processing, global compliance checks

Behavior Scoring

Continuous tracking for both clients and freelancers

Dispute Resolution

Automated triage, human mediation, evidence-based arbitration

Trust Scores

Clients: Payment reliability, communication, dispute history

Freelancers: Delivery consistency, QA results, reviews

08 — Revenue Model (System View)

Revenue Streams

Commission (Primary)

10–15% per completed transaction. Automated deduction via payment gateway.

Subscriptions

Pro / Elite tiers for enhanced visibility, analytics, and priority features.

QA/QC Fees

High-margin optional verification service. 25–30% projected adoption rate.

Premium Client Access

Enterprise hiring tools, dedicated account management, custom workflows.

QA/QC Revenue Projection Example

Monthly Jobs: 2,000 → QC Adoption: 25% → 500 jobs
Avg QC Fee: \$50 → Revenue = 500 × \$50 = \$25,000/month

Total System Revenue (MVP Scale)

STREAM	MONTHLY
Commission	\$120,000
QA/QC Fees	\$25,000
Subscriptions	\$40,000
Total Monthly Revenue	~\$185,000

09 — Security Architecture

JWT Authentication

Stateless token management with refresh rotation

RBAC

Role-Based Access Control for fine-grained permissions

Data Encryption

AES-256 encryption at rest and in transit (TLS 1.3)

Payment Security

PCI-DSS compliance via certified gateway integrations

Bot Protection

Rate limiting, WAF integration, behavioral anomaly detection

Audit Logging

Immutable action trails for compliance and forensic analysis

10 — Deployment Architecture

Infrastructure

Cloud: AWS / GCP
Containers: Docker
Orchestration: Kubernetes

Core Services

API Gateway (NGINX)
Load Balancer
Microservices Cluster
CI/CD (GitHub Actions)

11 — Scalability Design

- ✓ **Horizontal Scaling:** Stateless microservices allow independent scaling based on load
- ✓ **Queue Systems:** Kafka / RabbitMQ for asynchronous job processing and event streaming
- ✓ **Event-Driven Architecture:** Decoupled services communicate via events, ensuring resilience and fault tolerance
- ✓ **Database Sharding:** Regional data partitioning for low-latency cross-border transactions
- ✓ **Caching Strategy:** Multi-layer caching (Redis + CDN) for high-read operations like search and rankings

12 — Key System Differentiators

1

Separation of Concerns

Ranking $\neq$ Payment. Visibility $\neq$ Merit. System architecture enforces strict boundary between influence and performance.

2

QA/QC Integration

External validation layer built into core workflow. Direct, automated impact on merit scoring and trust rankings.

3

AI-Driven Marketplace

Reduced friction in hiring, higher trust in execution, predictive matching that improves with every transaction.

4

Balanced Incentive System

Clients feel prioritized through curated hiring. Freelancers feel protected through merit-based visibility and fair payouts.

Final System Summary

GetiDone is engineered as a next-generation platform that fundamentally restructures how freelance marketplaces operate. By decoupling merit from money and embedding verification into the core workflow, the system creates a self-reinforcing trust ecosystem.

Trust-First Marketplace

AI-Augmented Hiring

Merit-Driven Ranking

Revenue-Optimized

Quality-Verified

Scale Efficiently

Maintain Trust

Protect Revenue

Reward Performance
